We introduce here the outreach plan of the Italian large observational programme “Global Architecture of Planetary Systems”. GAPS' Team takes advantage of the high-resolution spectrograph HARPS-N, operated on the Italian *Telescopio Nazionale Galileo (TNG)*, and aims at studying exoplanets to answer some fundamental questions about the evolution of planetary systems. We have planned a strategy to popularize the science behind GAPS, and research results. The strategy includes highlighting the technological aspects of research, so important in these years, the engagement both of children and adults by various formats and also the use of different media.
