## Notional MSR Mission Architecture

Making significant progress towards Mars Sample Return (MSR) was recommended as one of the highest-priority goals for the decade 2013-2022 by the 2011 Planetary Decadal Survey. This research focuses on assessing technologies applicable to the Orbiting Sample (OS) capture and orientation functions of the Earth Return Orbiter (ERO). On-orbit OS capture is required for ERO OS retrieval, and orientation of the OS relative to the Earth Entry Vehicle (EEV) at landing is required to preserve the sample science.

## Capture and Orientation Module

The **Mars CAPture and ReORientation for Earth return (MACARONE)** Concept architecture would perform three primary functions: 1) OS capture from Mars orbit, 2) OS orientation to orient the sample tubes relative to the EEV landing orientation for sample science preservation, and 3) OS assembly in the Primary Containment Vessel (PCV) for bio-containment and break-the-chain operations.

**MACARONE Development Testbed**

**“Capture before Contact” Capture Lid**

- Contains potential dust on OS prior to first contact to reduce spacecraft contamination risk
- Eliminates the need to simulate contact dynamics for capture verification and validation analysis and testing
- Separates time-dependent capture function from other time-independent functions

Subsystem modularity allows for development flexibility and technology flexibility with clean:

- Functional partitioning
- Spatial partitioning
- Interfaces

**MACARONE Architecture Benefits**

**Rotating Cups Orientation Device**

- No physical OS modification required
- Cups stow within structure during OS capture
- Deterministic, quasi-static operation, testable in 1 G

Mission-critical containment hardware isolated from dynamic OS during capture, reducing risk of damage from contact

## OS Capture and Orientation Technologies

**Bladed Capture**

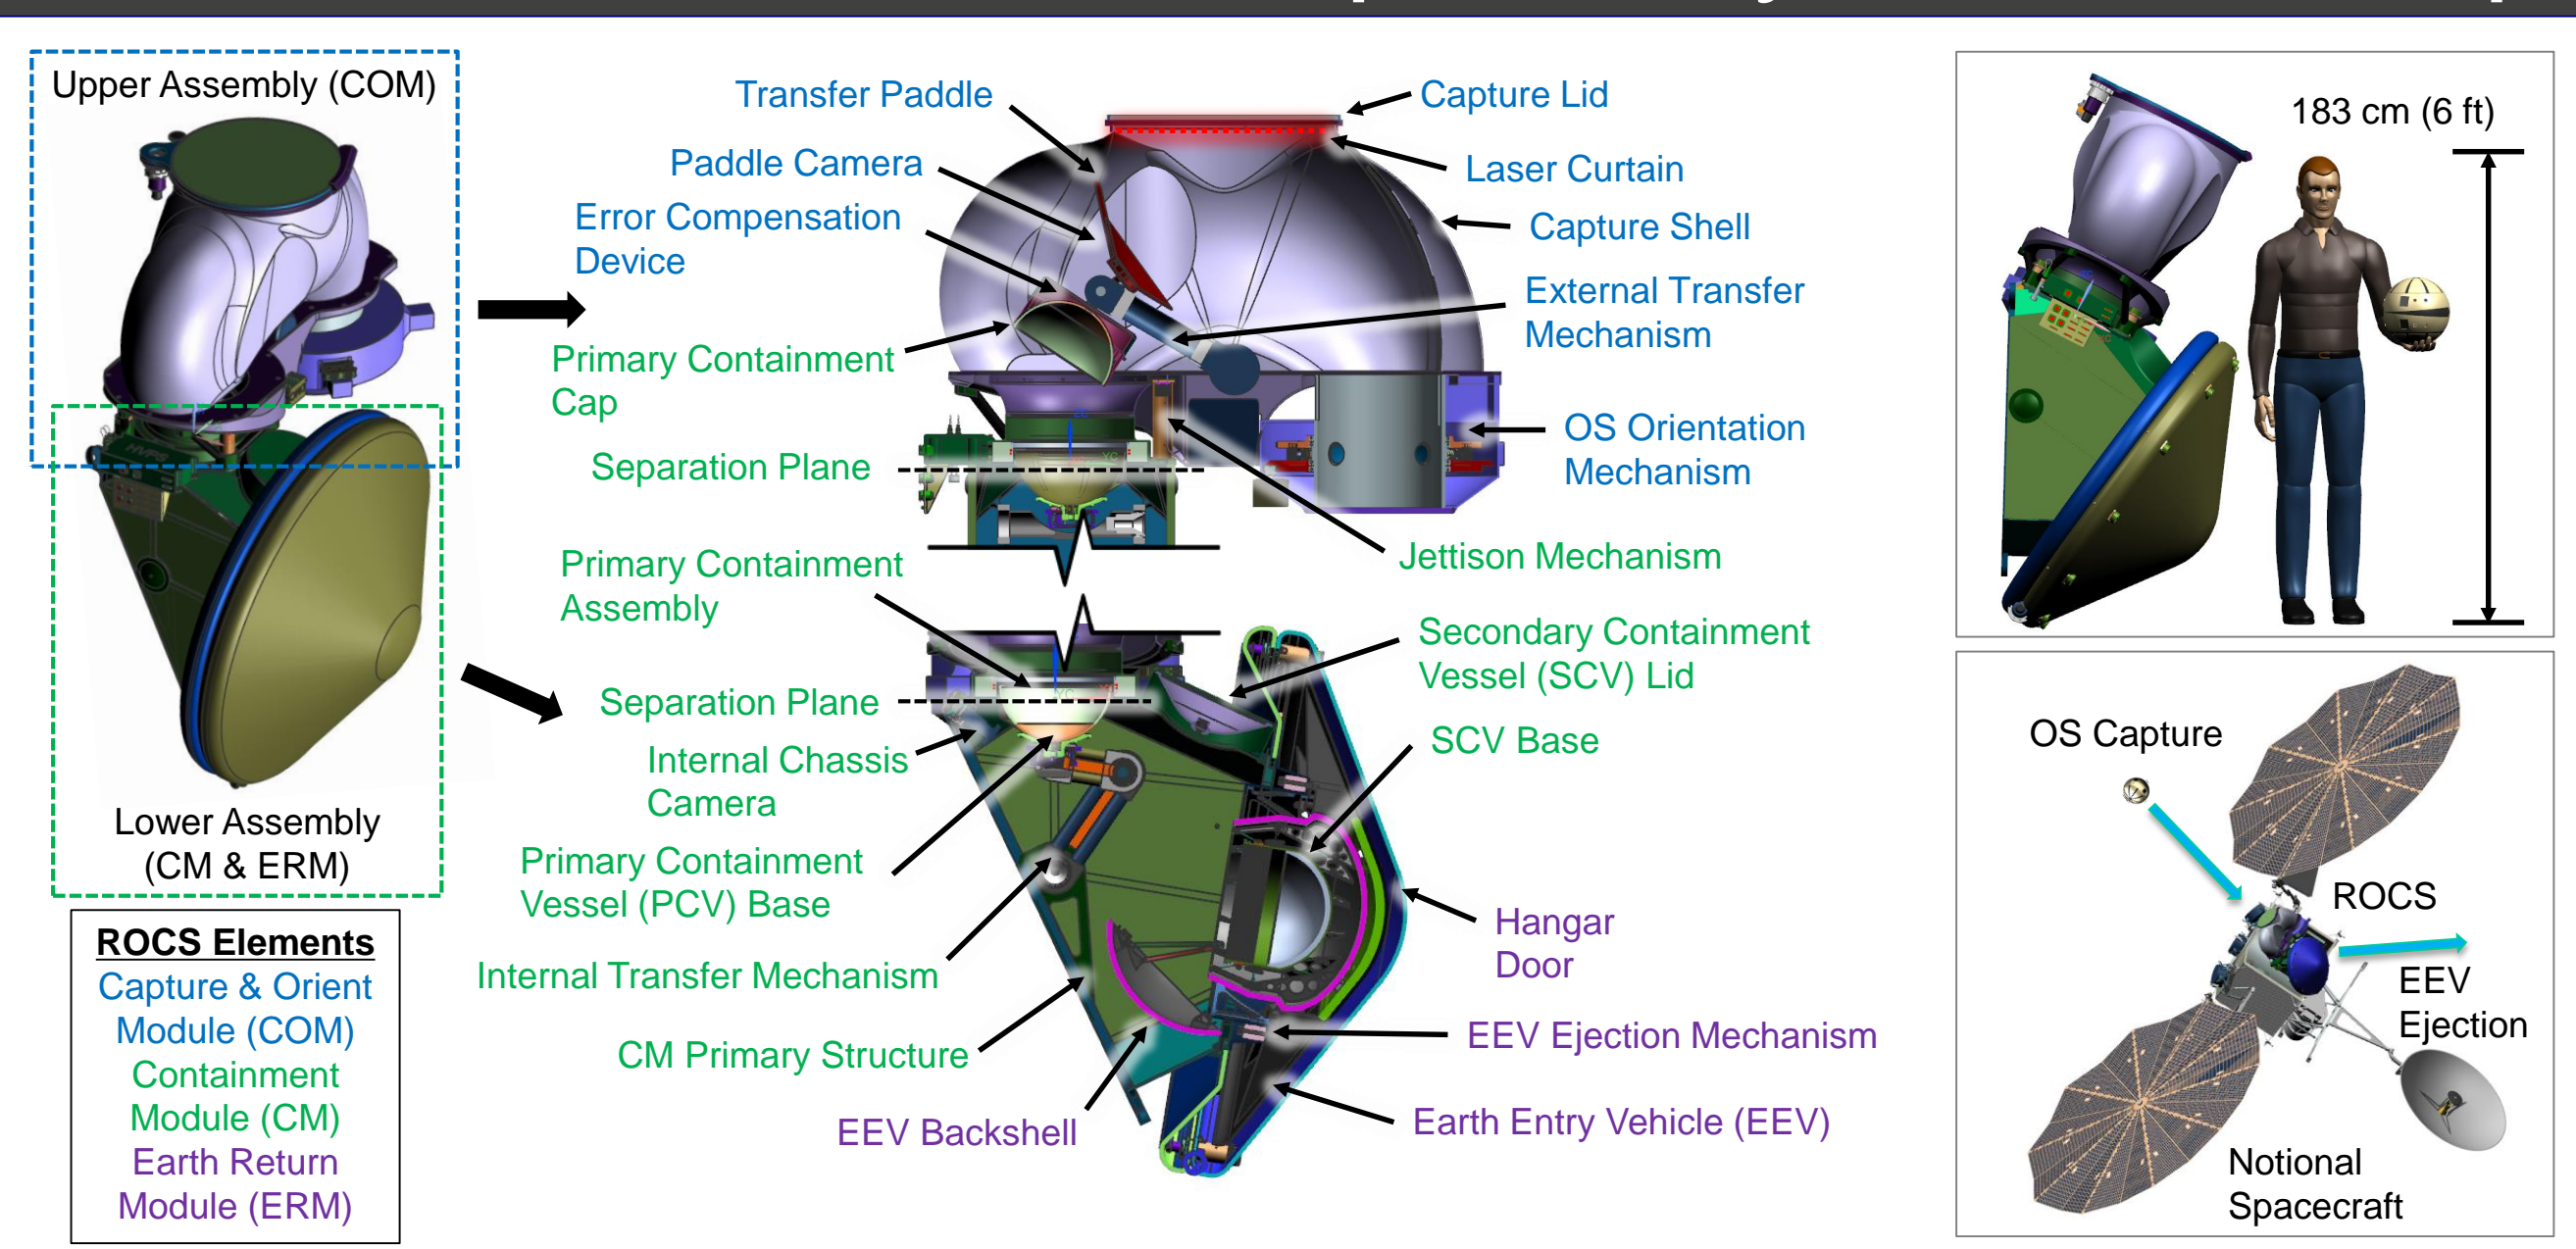

**Arm Capture**

**Flux Pinning Capture**

**Wiper Mechanism Orientation**

**Motorized Cups Orientation**

## Rendezvous and OS Capture System Concept
