Introduction: A complete global series of 1:3M-scale maps of Mercury is being prepared in preparation for the forthcoming ESA/JAXA BepiColombo mission to aid selection of scientific targets and to provide context for interpretation of new data [1].

Mapping status: This coordinated global geological mapping of Mercury plan exploits NASA MESSENGER Mercury Dual Imaging System (MDIS) images at the best resolution available (i.e., global average resolution of 166 m/pixel). Our mapping protocols follow the mapping standards document of the Planmap project [2], which are modelled closely on the USGS equivalent. Maps from H02 to H05 have already been published [3-6] and others are in progress [e.g., 6-10] or scheduled except H01. Quadrangles H10 and H14 are completed and available in the Planmap repository [12, 13] (Fig. 1). We merge the produced geologic maps together by adjusting mismatches along the quadrangle boundaries. The global merged output will be used as a digital full-scale product, which will permit detailed global or regional analyses of Mercury’s surface. This project will lead to a fuller grasp of the planet’s stratigraphy and surface history.

Acknowledgments: This project has received funding from the Italian Space Agency (ASI) under ASI-INAF agreement 2017-47-H.0 and the European Union’s Horizon 2020 research and innovation program under grant agreement No 776276.

Figure 1. Status of the European coordinated quadrangle mapping of Mercury: green, completed and published; yellow, completed; orange, in progress; blue, scheduled; grey, not scheduled.
